Method and interpretation

Only complete 60-second HDF windows are classified. Welch power spectral density uses a Hann window, 8-second segments and 50% overlap. The dominant band has the greatest mean PSD among 1-4, 4-8, 8-16 and 16-20 Hz. Missing minutes break runs. Exact duplicate files count once. Frequency classification uses raw counts; calibrated pressure, dBA, dB(G), benchmark exceedances, health effects, legal violations and source attribution are not determined. EHZ is never combined with HDF.

*Account for up to 30 minutes of lag. Archive dates above remain the controlling measurement dates.
